DETAILED ACTION

1. This office action is in response to applicant's response filed on 07/14/2009.
2. Claims 1-5, 8, 10, 11, 13-14, 17-21, 24, 26-27, 29-30, 33-35, and 37-43 are pending.
3. Claims 6-7, 9, 12, 15-16, 22-23, 25, 28, 31-32, 36, and 44-48 are cancelled.
4. Applicant's arguments are persuasive in the light of Applicant Remarks filed on 07/14/2009. Therefore the rejections of the claims have been withdrawn.

Allowable Subject Matter

1. Claims 1-5, 8, 10, 11, 13-14, 17-21, 24, 26-27, 29-30, 33-35, and 37-43 are allowed.
2. Independent claims 1, 17 and 33 are the inclusion of the following limitations that are not found in the prior art and they are uniquely distinct features. The closest prior arts are Gong, Patent No. US 6,044,467 and Scheifler et al., Patent No.: US 6,389,540 B1.

Gong discloses a method and apparatus for providing security in a computer system is provided. When code associated with an object class must be loaded, a search for the code is performed, inspecting locations in predetermined sequence, where the sequence ensures that untrusted code can not be loaded in place of trusted code. The sequence of locations may include locations specified by a user as well as

Art Unit: 2434

locations specified by a default pathway. If the class is found and the class has not been loaded, the class is loaded and a set of permissions is associated with the class based on a predetermined mapping of code sources to permissions. And Scheifler discloses a system regulates access to resources requested by an operation executing on a computer. The operation invokes a plurality of methods that operate upon code during execution. The system includes a policy file, a call stack, and an execution unit. The policy file stores permissions for each of the resources. The permissions authorize particular types of access to the resource based on a source of the code and an executor of the code. The call stack stores representations of the methods and executors in an order of invocation by the operation. The execution unit grants access to the resource when the types of access authorized by the permissions of all of the methods and executors on the call stack encompass the access requested by the operation.

However, these arts individually or in combination, fail to anticipate or render the following limitations: “A computer-readable storage media comprising computer-executable instructions that, when executed by a processor, perform steps method comprising:

receiving a manifest defining first, second, and third code assemblies that are members of at least one application, wherein the manifest defines at least one trusted application and application evidence for making a trust decision;

evaluating the application evidence to determine if the at least one application is trusted;

generating a first, a second, and a third permission grant set for the first, the second, and the third code assemblies, respectively, that are members of the at least one application if the application evidence satisfies at least one condition for trusting the at least one application;

passing the permission grant sets to a run-time call stack; calling the second code assembly by the first code assembly;

calling the third code assembly by the second code assembly, the third code assembly attempting access of a protected file; and

calculating an intersection of the first and the second permission grant sets to determine whether the access to the protected file is permitted” as claimed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
